

Deployment example for TransCast AD Load & Go

This application was designed specifically to operate in systems delivering audio description files for playout. It can be used in a pre-transmission tape preparation mode, or during live transmission for real-time applications.

The interconnection diagram below shows a DigiBeta® Player connected to a DigiBeta® Recorder with audio description tracks added during the tape copy. The composite video monitoring feed (that must have VITC in the VBI lines) feeds a timecode reader card in the PC, this then triggers TransCast AD Load & Go to output the AD audio via a broadcast quality audio card.
